

Historical sales import

How Ledrix reconstructs past clients, orders, payment links, and payments from a spreadsheet — without inventing data.

Document date: September 3, 2026 · Product: Ledrix CRM · Audience: tenant administrators

Why this exists. Agencies moving onto Ledrix already have years of sales in Excel, Stripe exports, or another CRM. Without import, the new workspace starts empty: no past clients, no revenue history, no way to see who already paid. Import copies that history into the four records Ledrix uses every day — leads, orders, payment links, and payments — so reporting and client follow-up match the real past.

What it is not. It is not a live Stripe sync and not a seller self-serve tool. Administrators upload a CSV, map columns, preview, then commit. Empty cells stay empty. Ledrix never fabricates Stripe or PayPal IDs.

1. Why you need it

- **Start with a full book, not a blank CRM.** Past buyers, invoices, and cash collections should already be in Ledrix on day one.
- **Keep money history honest.** Orders and payments drive dashboards, seller credit, and “who has paid.” History has to land in those same tables, not a side spreadsheet.
- **Your sheet does not need Ledrix column names.** Exports from Excel, Stripe, or another CRM almost never match. Mapping lets you use whatever headers you have.
- **Do not invent processor IDs.** Fake checkout or payment IDs would break later Stripe/PayPal matching. Cash and check rows are stored as payments with no link and no provider ID.
- **Preview before write.** You see counts, unmatched brands, and duplicates before anything is created. You can roll a committed batch back.

2. Who can import

Administrators only. Finance accounts and sellers cannot open `/admin/import`. Sellers still see imported leads and orders in the CRM after commit; they do not upload the sheet.

3. What you need before upload

- At least one **brand** (the LLC / site the sale belonged to).
- At least one **seller** — every lead in Ledrix must have an owner. Pick the historical owner, even for old records.
- A **CSV** file. In Excel: File → Save As → CSV UTF-8. .xlsx is not accepted (no Excel engine on purpose).
- Each contact row needs an **email**. Name can fall back to the email. Phone is optional.

If you do not have a sheet yet, download the **sample CSV** from the import page. It includes contacts-only, invoiced-but-unpaid, and cash rows.

4. How a row becomes CRM records

Commit creates records only from data that is present. Blank cells are ignored, not filled with placeholders.

What is in the row	What Ledrix creates
Name / email (optional phone)	Lead, plus a client from that contact (no portal invite)
+ order amount	Lead + order
+ amount paid, no Stripe/PayPal link ID (cash, check, blank provider)	Lead + order + payment. No payment link. Provider IDs stay empty
+ Stripe or PayPal + a real provider link ID from the sheet	Lead + order + payment link (and payment if amount paid is present)

A payment link is created only when the provider is **stripe** or **paypal** and the sheet has a real provider link / session ID. Ledrix may store its own internal token (imp-...) for the CRM link. It will not invent cs_... or pi_... values.

5. Step by step

1. **Open Import sheet** (Admin sidebar, or Leads → Import sheet).
2. **Choose the brand** all rows belong to — or tick “Sheet spans multiple brands” (see below).
3. **Assign to seller** — required historical owner.
4. Leave **Enter live pipeline** off for history (see below).
5. **Upload the CSV** → map each of your headers to a Ledrix field, or Ignore. Unmapped columns are not errors. Mapping is remembered for your next import.
6. **Preview** — counts for leads created/matched, orders, pay links (real ID vs unknown), payments, payments without a link, review flags, unmatched brands, duplicates. Nothing is written yet.
7. If duplicates exist (same brand + email or phone), choose one action for the whole batch: **Merge**, **Skip**, or **Create new**. Duplicates are never imported silently.
8. **Commit**. Then check Leads / Orders / Payments. Use **Roll back** on that batch if the result is wrong.

6. The two checkboxes

Sheet spans multiple brands

Off (typical): pick one brand in the dropdown. Every imported row belongs to that brand.

On: the dropdown is ignored. Map a column to **brand name**. Each cell must match an existing brand (name match is case-insensitive). Rows that do not match are listed in preview and are **not** imported — they are not dropped quietly.

Enter live pipeline

Off (typical for history): records are stored only. No assignment, no routing, no “new lead” emails.

On: each new lead is assigned to the seller you picked so it appears in the live assigned-lead workflow. Use this only if these people should be worked now, not just archived.

7. Column mapping

Your headers can be anything (“Customer”, “Mail”, “Paid \$”). On the map screen, point each one at:

Ledrix field	Use it for
Lead — name / email / phone	Who the person is. Email is required to create a lead.
Order — amount / status	Deal size (dollars in the sheet, stored as cents). Status is optional.
Payment link — provider / provider ID	stripe or paypal, plus the real session / link ID from the processor if you have it.
Payment — amount paid / paid at / provider payment ID	Money collected, when, and the real pi_... / transaction ID if the sheet has one.
Brand name	Only for multi-brand sheets.
Ignore	Notes, UTMs, extra columns. Not an error.

Amounts in the sheet are treated as **dollars** (for example 1500.00 → \$1,500.00), not cents.

8. Duplicates, review, rollback

- **Duplicate** means same brand and the same email (or same phone). Preview lists them. You must choose merge, skip, or create new for the whole file.
- **Merge** adds new orders/payments onto the existing lead. It does not overwrite the old contact blindly.
- **Review flags** mark imported processor IDs that Ledrix did not verify with Stripe/PayPal, or unknown providers / link IDs it could not store as a pay link.
- **Rollback** removes that batch’s payments, then pay links, then orders, then imported leads that have no other remaining orders. Clients created as contacts are left in place.

9. What import will never do

- Invent Stripe/PayPal session or payment IDs.
- Create a payment link only so a payment has a parent — cash payments keep `payment_link_id` empty.
- Create empty orders, links, or payments just to satisfy foreign keys.
- Email clients or open a client portal.
- Route leads unless “Enter live pipeline” is on.

Path: Admin → Import sheet · Sample CSV and this guide are both available on that page.
