

Ledrix Platform Handling Guide

Completed Super Admin / platform operations features — what they are, why they matter, and how to use them.

Document date: August 27, 2026 · Product: Ledrix multi-tenant SaaS CRM

Audience: Platform owners and Super Admins who operate tenants, billing, security, and support.

Scope: Features already shipped for central/platform handling. Each feature lists **Why** (purpose), **When** (typical trigger), and **How** (where to click / what to configure). CRM day-to-day lead/order work is out of scope unless it is platform-gated.

1. Where to work

Area	URL / entry	Who
Super Admin (platform)	/super-admin	Owner / Admin / Support roles
Public marketing & status	/, /status	Anyone
Org portal (tenant owner)	Tenant login → Organization	Tenant admin
Admin / Seller / Client CRM	/admin, /seller, /client	Tenant users

2. Access, team & security

Super Admin auth, roles & invites

WHY Only trusted staff should manage tenants, payments, and erasure. Roles limit damage if an account is compromised.

HOW Sign in at Super Admin login. Owner/Admin invite teammates (Team). Roles: Owner (full), Admin (mutations), Support (mostly read + tickets). Enable 2FA on every SA account.

Forced owner 2FA (production)

WHY Platform owners hold the keys to all tenants; password-only is too weak for production.

HOW Configure force-2FA via security env/settings. After login, Owner is redirected to set up TOTP until enabled. Keep recovery codes offline.

OIDC SSO (SA + CRM Admin)

WHY Enterprises want IdP-controlled login (Okta, Azure AD, etc.) instead of local passwords.

HOW Super Admin → SSO: enable, set issuer, client ID/secret, redirect URI, scopes. Users use “Sign in with SSO”. Enable SCIM (SCIM_ENABLED=true, SCIM_BEARER_TOKEN) for IdP user sync at /api/scim/v2/Users.

Optional 2FA — Admin, Seller, Client portals

WHY Reduces account takeover on CRM and client portals without blocking tenants who do not need it.

HOW Each user enables 2FA from their profile/security page. On next login they complete a TOTP or recovery-code challenge.

SA impersonation (CRM Admin)

WHY Support can reproduce tenant issues without asking for passwords.

HOW Tenant detail → Impersonate. Banner shows active session; always Stop Impersonation when done. Actions are audited.

3. Tenants & lifecycle

Tenant directory, plans, limits & feature flags

WHY Plans productize capacity (seats, storage, modules). Overrides fix edge cases without shipping a custom build.

HOW Super Admin → Tenants: open a company, review plan/membership, edit feature/limit overrides when needed. Prefer plan changes over permanent one-off flags.

Suspend / activate / offboard / restore

WHY Non-payment, abuse, or churn must stop CRM access without deleting history prematurely.

HOW Tenant detail: Suspend (with reason), Activate, Offboard (lifecycle end), Restore if offboarded by mistake. Confirm impact before offboarding.

Storage metering & usage alerts

WHY Storage has cost; tenants should upgrade or clean up before hard failure.

HOW Usage is metered into central snapshots. Scheduler job emails at ~80% and 100% of plan storage; alerts clear when usage drops. Review usage on tenant/org dashboards.

Custom domain / white-label (tenant + Super Admin)

WHY Agencies want CRM on their own hostname for trust and branding.

WHEN Use when a tenant's plan includes Custom Domain, or when SA provisions a hostname for an agency before go-live. Shared hosting can store + verify DNS; automatic SSL/vhost still needs VPS or Cloudflare later.

HOW Every tenant gets {slug}.ledrix.co at registration (no tenant DNS). Optional BYOD: tenant enters crm.theirbrand.com in Organization → Connect your own domain; CNAME to ledrix.co and Verify. SA: Tenant detail → Workspace URL + Connect own domain. Platform ops: wildcard DNS *.ledrix.co + SSL.

4. Billing & payments (platform)

Payment Accounts (Stripe, Meezan primary; PayFast / JazzCash / Payoneer optional)

WHY Platform collects SaaS subscription money; credentials must live centrally and stay rotatable.

WHEN Before first paid signup. Primary rails: **Pakistan → Meezan (PKR), international → Stripe** (UAE Stripe account can replace keys later without code changes). Keep PayFast/JazzCash off until you need them.

HOW Super Admin → Payment Accounts: enable providers, paste keys/secrets, save. Never commit secrets to git. After changes, smoke-test one Stripe and one Meezan path.

Multi-currency + FX Rates (F-23)

WHY List prices stay in USD while tenants pay PKR, AED, EUR, or GBP. Dashboard MRR/ARR must roll up into one base currency for operators.

WHEN Launch (set USD→PKR and USD→AED). Whenever FX moves enough to matter. When onboarding UAE tenants (country AE defaults to AED). When reviewing SA dashboard revenue across regions.

HOW Super Admin → FX Rates: add/update pairs (rate = quote units per 1 base, e.g. 1 USD = 280 PKR). Empty table seeds config defaults on first visit. Tenant billing currency comes from preferred currency or country (PK→PKR, AE→AED, else USD). Stripe Checkout charges that currency; Meezan stays PKR. Plan PKR columns win when set; otherwise USD × FX. Dashboard MRR/ARR are FX-normalized to base currency (default USD).

Stripe Checkout Subscriptions + lifecycle webhooks

WHY International cards should auto-renew; membership must update even if the browser never returns from Stripe.

WHEN Any non-Pakistan tenant paying by card. Also for upgrades (one-shot payment mode) and renewals issued by SA.

HOW Tenant Billing → Pay with Stripe. Register SaaS webhook events: `checkout.session.completed`, `invoice.paid`, `invoice.payment_failed`, `subscription.updated/deleted`. Super Admin → Webhook Events to inspect/retry. Cancel-at-period-end syncs to Stripe when a subscription ID exists.

Stripe Customer Portal (F-26)

WHY Tenants need self-serve card updates and Stripe invoices without opening support tickets.

WHEN After a tenant has completed at least one Stripe Checkout (has `stripe_customer_id`). Not for Meezan/PKR buyers.

HOW Enable Customer Portal in Stripe Dashboard. Tenant Billing → **Manage in Stripe**. Returns to Organization Billing. Local cancel-at-period-end remains available so CRM access rules stay under Ledrix control.

Past-due CRM grace (dunning window)

WHY A failed auto-charge should not lock the CRM for a few days while Stripe retries.

WHEN Stripe subscription enters `past_due`. Configure days via `SUBSCRIPTION_PAST_DUE_GRACE_DAYS` (default 7). Client portal stays open even if SaaS subscription expired — only Admin/Seller CRM is billing-gated.

HOW No SA click required for the grace itself. Watch Webhook Events for `payment_failed`. Issue a renewal invoice or ask the tenant to update the card in Stripe Portal if grace is ending.

Unified renewal invoice (replaces legacy approve link)

WHY One path for SA-issued renewals: invoice + email + Organization Billing pay link.

WHEN Tenant expired/expiring, manual follow-up, or ops wants them to pay now without waiting for scheduler mail.

HOW Tenant detail / renewal flows → Issue renewal invoice. System picks Meezan for PKR or Stripe for international currency, emails the tenant, and they pay from Org Billing.

Self-serve plan change / proration (F-10)

WHY Upgrades and downgrades without SA ticket spam.

WHEN Active subscription; upgrade now (prorated invoice) or schedule change at period end / downgrade.

HOW Organization → Plan: choose target + timing. Immediate upgrades create a payable invoice on the correct gateway. Pending changes apply on next successful renewal activation.

Void invoice + refund / billing credit (F-12)

WHY Mistakes, goodwill, and chargebacks need a controlled undo without deleting audit history.

WHEN Void: issued but unpaid wrong invoice. Refund: paid invoice (Stripe refund when a PaymentIntent exists; otherwise credit lands in tenant billing credits).

HOW Tenant detail → invoice actions (Admin SA role). Confirm before refund. Credits reduce the next invoice in that currency.

SaaS invoice PDF + tax/VAT

WHY Finance teams need downloadable invoices; some regions need tax lines.

WHEN Tenant downloads from Billing; set INVOICE_TAX_RATE / INVOICE_TAX_LABEL when you must show VAT/GST.

HOW PDF generated on demand (DomPDF). Tax applies at invoice creation rounding per currency (whole units for PKR, 2 dp for USD/AED).

MRR / ARR / 30d churn (dashboard)

WHY Operators need a weekly health snapshot of paid SaaS revenue.

WHEN Every SA dashboard visit; especially after FX rate changes or multi-region growth.

HOW Super Admin home: MRR/ARR in base currency (FX-normalized), active paid count, 30-day churn rate. Per-currency buckets still computed internally for transparency.

Subscription payments & manual confirm

WHY Meezan bank transfer / Payoneer are not instant; ops must mark paid to activate membership.

WHEN Pending bank transfer after tenant reports a transaction ID; Payoneer settlements.

HOW Super Admin → Subscription Payments: review pending, confirm when funds clear. This activates/extends the tenant subscription.

Renewal requests & cancel-at-period-end

WHY Tenants renew or cancel without losing access mid-cycle; support needs a queue of renewal asks.

WHEN Tenant cancels auto-renew; JazzCash token renewals where that provider is on; SA reviews Renewal Requests queue.

HOW Monitor Renewal Requests. Cancel keeps CRM until period end. Stripe cancel-at-period-end syncs when a subscription ID exists.

Invoices, due/paid emails, trial schedulers

WHY Clear billing history and reminders reduce churn and support tickets.

WHEN Always in production — cron must run.

HOW System creates tenant invoices and emails on due/paid. Cron (schedule:run) for trial expiry and renewal reminders (7d / 3d / 1d).

Stripe platform webhook + Webhook Events UI

WHY Card payments must update invoices/membership even if the browser never returns.

WHEN After every Stripe Payment Accounts change; anytime a tenant says “I paid but CRM is locked”.

HOW Register the SaaS Stripe webhook in Stripe Dashboard. Super Admin → Webhook Events: inspect failures and Retry. Keep `QUEUE_CONNECTION` non-sync in production.

Pricing packages CRUD

WHY Public pricing and plan entitlements must stay editable without a deploy.

WHEN New package launch, promo pricing, or PKR list-price updates (optional columns; else FX converts from USD).

HOW Super Admin → Pricing Packages: create/edit plans, USD/PKR prices, trial days, popularity, status.

Referrals (issue / reward / expire)

WHY Growth loop for agencies referring peers; rewards need human approval to prevent abuse.

WHEN Campaigns or when a referred tenant converts and qualifies for credit.

HOW Super Admin → Referrals: issue codes, mark rewarded when criteria met, expire stale ones. Credits apply per currency on the next invoice.

5. Data protection, backup & compliance

GDPR / workspace data export

WHY Customers can request a copy of their workspace data; regulators expect a controlled path.

HOW Tenant requests export → Super Admin Data Exports approve/reject → ZIP of CSVs generated. Tenant download window is time-limited; purge job cleans expired files. SA can generate immediately from tenant detail.

GDPR erasure (SA)

WHY Right to be forgotten / contract end — remove tenant-held personal/business data when legally required.

HOW Tenant detail → Erasure (destructive). Confirm identity and legal basis first. Prefer export backup before erase.

Per-tenant backup & restore (ZIP)

WHY Recover from accidental wipe or bad import without restoring the whole platform.

HOW Tenant detail → Backup. Restore supports dry-run then force. Treat restore as high-risk; run dry-run and communicate downtime.

Audit logs

WHY Forensics and accountability for SA and sensitive tenant actions.

HOW Super Admin → Audit Logs. Filter by tenant/action. Clear only when retention policy allows.

6. Integrations & APIs

Tenant API tokens + Management API

WHY External systems need to pull company, membership, invoices, and usage without scraping the UI.

HOW Issue tokens (org portal or SA). Call `/api/v1/company|membership|invoices|usage` with Bearer / X-API-Token. Revoke leaked tokens immediately. Feature requires API access on the plan.

Outbound tenant webhooks

WHY Push events (e.g. invoice paid, membership activated) into Zapier, ERP, or custom backends.

HOW Admin Organization → Webhooks: add HTTPS URL, secret, events. Platform signs payloads; consumer verifies HMAC. Check delivery history on failures.

7. Communications & trust

System announcements (+ maintenance broadcast)

WHY Tell all tenants (or one plan) about incidents, upgrades, or policy changes. Maintenance can pause CRM safely.

HOW Super Admin → Announcements: title, message, type (incl. maintenance), target, window. Check “Block Admin & Seller CRM” for a 503 maintenance page during windows. Prefer short windows and a matching status incident.

Public status / SLA page

WHY Customers expect a single place for uptime honesty; reduces “is it down?” tickets.

HOW Public /status. Super Admin → Status Page: set component health, publish incidents, subscribers opt in by email. Update components when you start/end maintenance.

Website Theme

WHY Brand the marketing site without a front-end deploy for simple color changes.

HOW Super Admin → Website Theme: set primary/secondary colors; preview and save. Reset restores default Ledrix indigo.

Support tickets, demos, contact queries

WHY Central inbox for sales and support so leads and issues are not lost in email.

HOW Super Admin → Support Tickets (reply/status), Demo Requests, Contact Queries. Set BILLING_ADMIN_EMAIL for ops alerts.

8. Org portal capabilities (tenant self-serve)

These are completed for tenant admins; platform staff should know them when guiding customers:

- Billing: Meezan PKR or Stripe multi-currency · Manage in Stripe portal · cancel / auto-renew
- Self-serve plan change (period-end or immediate prorated upgrade)
- Organization overview, team seats, plan matrix, org settings
- API tokens, webhooks, custom domain/white-label (feature-gated)
- Workspace audit log, data export request, Admin optional 2FA
- Dashboard health, usage limits, and platform announcements
- Client portal stays available when SaaS subscription is only expired (not suspended)

9. Daily / weekly ops checklist

Cadence	Actions
Daily	Pending Meezan/Payoneer payments · support tickets · open status incidents · failed Stripe webhook events
Weekly	Dashboard MRR/ARR · renewal requests · referral rewards · storage alert tenants · FX sanity (USD→PKR / AED) · audit suspicious SA actions
Before maintenance	Publish status incident · announcement with Block CRM if needed · notify key tenants
After deploy	Central + primary migrations · optimize:clear · confirm cron/queue · smoke Stripe + Meezan checkout

11. Enterprise & plan-gated CRM features (shipped)

These modules are controlled per pricing package and via Super Admin feature overrides on each tenant. Platform domain: **ledrix.co** (production APP_URL / SEO_SITE_URL). Enable on a plan in Pricing Packages, or override on Tenant detail when closing an enterprise deal.

Feature key	What it does	Where / how	Status
PPC module	Core CRM: leads, orders, brands, seller assignment, pipeline.	Admin / Seller CRM when plan includes module.	Shipped
Stripe payments	Tenant Stripe keys; payment links and checkout for client orders.	Admin → Account Keys; order payment links.	Shipped
PayPal payments	Tenant PayPal keys; PayPal checkout on orders.	Admin → Account Keys.	Shipped
Payment webhooks	Stripe/PayPal webhook processing for missed or async payments.	Register tenant webhooks; platform processes capture/refund events.	Shipped
Milestone payments	Installment / milestone payment links on orders.	Order flows when feature enabled on plan.	Shipped
Chargeback tracking	Dispute and refund webhook handling on tenant payment rails.	Stripe/PayPal dispute & refund webhook endpoints.	Shipped

Dual invoicing	Advanced invoicing options for tenant client billing.	CRM invoicing when plan includes feature.	Shipped
Lead classification	AI lead scoring and classification on intake.	Lead intake / classification when enabled.	Shipped
Client portal	Client login, invoices, order visibility.	/client — stays available even when SaaS subscription expired (not suspended).	Shipped
Support tickets	Order-linked client support tickets.	Client portal + Admin ticket handling.	Shipped
Projects module	Project management linked to CRM work.	Admin CRM when plan includes projects.	Shipped
Seller leaderboard	Seller performance rankings.	Admin / Seller dashboards when enabled.	Shipped
Performance bonus	Bonus tracking for closers.	Team / seller compensation flows.	Shipped
API access	Public lead/branding API and tenant Management API tokens.	Org → API tokens; /api/v1 with Bearer token.	Shipped
Outbound webhooks	Push tenant events (invoice paid, membership, etc.) to external systems.	Org → Webhooks; HMAC-signed payloads.	Shipped
Custom domain	Agency hostname on Ledrix CRM (DNS set + verify).	Org → Custom domain; SA Tenant detail. Seller login resolves verified host today.	Default {slug}.ledrix.co automatic; optional BYOD with DNS verify
White label	Replace Ledrix logo in CRM chrome with tenant branding.	Org → Branding (logo upload); Admin top bar.	Shipped (logo); full hostname white-label pairs with Custom domain F-27
OIDC SSO	Enterprise IdP login for Super Admin and CRM Admin (Okta, Azure AD, etc.).	Super Admin → SSO settings; “Sign in with SSO”.	Shipped (login only; SCIM auto-provisioning deferred — 501 stub)

Multi-currency + FX	USD list prices; tenants pay PKR, AED, EUR, GBP; MRR/ARR normalized.	Super Admin → FX Rates; tenant billing currency from country/preference.	Shipped
Stripe Customer Portal	Self-serve card update and Stripe invoices for SaaS billing.	Org Billing → Manage in Stripe (after first Stripe Checkout).	Shipped
GDPR export / erasure	Workspace data ZIP export; SA destructive erasure.	Org export request; SA Data Exports + Tenant detail erasure.	Shipped
Per-tenant backup / restore	ZIP backup and restore for one workspace (shared DB, tenant-scoped rows).	SA Tenant detail → Backup / Restore (dry-run supported).	Opt-in via <code>TENANT_DB_ISOLATION=true</code> ; new tenants auto-provision with <code>tenants:provision-db</code>
Workspace audit log	Tenant-visible audit trail for sensitive org actions.	Organization → Audit log.	Shipped
SA impersonation	Support enters tenant CRM as admin without passwords.	SA Tenant detail → Impersonate (audited).	Shipped

12. Domains & workspace URLs — SA runbook

Ledrix uses **two domain layers**. Most tenants only need layer 1.

12.1 Default workspace URL (automatic)

What	{slug}.ledrix.co — slug is created at tenant registration from org name
Example	Org “Tech Dev Agency” → slug techdev → https://techdev.ledrix.co/admin
Tenant DNS	None. Works immediately after signup.
Platform DNS (once)	Wildcard *.ledrix.co → app server or Cloudflare proxy
Panels	/admin · /seller · /client · /tenant-profile

SA steps — new tenant

1. Super Admin → Tenants → open company.
2. Note **Workspace URL** card: slug, hostname, panel links.
3. Send tenant their Admin link: <https://{slug}.ledrix.co/admin>.

4. No domain feature flag required for workspace URL — it always exists.

12.2 Connect own domain (advanced / enterprise)

When a tenant wants CRM on *their* domain (e.g. `crm.techdev.com` where they own `techdev.com`), not on `techdev.ledrix.co`.

Plan feature	feature_custom_domain on package, or SA override on tenant
Tenant enters	Subdomain they control — e.g. <code>crm.techdev.com</code> (not <code>*.ledrix.co</code>)
Tenant DNS (at GoDaddy / Cloudflare)	CNAME <code>crm.techdev.com</code> → <code>ledrix.co</code> or TXT verify token shown in UI
Ledrix verifies	Organization → Verify DNS, or SA → Verify DNS on tenant detail
After verify	Same CRM paths work on tenant hostname; session scoped to that tenant
SSL	Tenant or SA must terminate HTTPS on custom host (Cloudflare / VPS cert)

SA steps — BYOD setup

1. Ensure plan includes Custom Domain, or save domain on tenant detail (auto-enables override).
2. Tenant (or SA) saves hostname under **Connect own domain (advanced)**.
3. Give tenant DNS instructions from tenant detail (CNAME target = platform host from `APP_URL`).
4. After tenant adds DNS, click **Verify DNS**. Status → Verified.
5. Configure SSL on custom hostname (Cloudflare orange cloud or origin cert).
6. Smoke-test: `https://crm.theirbrand.com/admin/login` resolves correct tenant.

Common mistakes

- Tenant enters `techdev.ledrix.co` in BYOD field — blocked; that URL is already automatic.
- Tenant enters root `techdev.com` without subdomain — prefer `crm.techdev.com` or `app.techdev.com`.
- DNS not propagated — wait and re-verify.

13. DB-per-tenant isolation — SA runbook

By default all CRM data lives in one shared primary database with `tenant_id` row scoping. Enterprise isolation gives each tenant a dedicated CRM database.

13.1 When to use

- Enterprise contract requiring physical data separation.
- Custom domain + compliance / backup per customer.
- Not required for standard launch on shared DB.

13.2 Enable platform-wide

1. On VPS with MySQL user that can CREATE DATABASE, set in .env:
TENANT_DB_ISOLATION=true
TENANT_DB_PROVISION_ON_REGISTER=true
TENANT_DB_PREFIX=ledrix_tenant_ (optional)
2. Run central migration: `php artisan migrate --database=central --path=database/migrations/central` (adds `tenants.crm_database`).
3. New registrations auto-create `ledrix_tenant_{id}` and run CRM migrations on that DB.

13.3 SA steps — existing tenant

1. Super Admin → Tenants → open company.
2. Confirm `TENANT_DB_ISOLATION=true` on server.
3. SSH to server: `php artisan tenants:provision-db {tenantId}`
4. Tenant row gets `crm_database` (e.g. `ledrix_tenant_42`).
5. **Data migration:** existing rows still in shared primary until F-28-migrate tooling runs — plan maintenance window for enterprise cutover.
6. After cutover, requests for that tenant switch CRM connection automatically via middleware.

13.4 What stays on central DB

Tenants, billing, memberships, invoices, packages, audit logs, API tokens registry — always on `central`. Only CRM tables (leads, orders, admins, sellers, etc.) move to tenant DB when isolated.

13.5 Backup & restore

- Shared DB tenants: SA Tenant detail → Backup (exports tenant-scoped rows from primary).
- Isolated DB tenants: backup includes dedicated database; restore targets that DB name on `tenants.crm_database`.

14. Intentionally deferred (context)

Do not treat these as required for launch with Meezan + Stripe:

- PayFast / JazzCash **server** ITN webhooks (F-03) — turn on only if those Payment Accounts go live
- Per-tenant automatic SSL/vhost for custom domains — app routing is shipped; hosting/CDN still required for production hostnames
- **F-28-migrate** — bulk migration tooling for existing tenants on shared primary DB (new tenants auto-provision when isolation is on)
